What is it?

Linux was originally created by a Finnish student name Linus Torvalds in 1991, as a research project and hobby, and released as free software . Over the last decade and a half, Linux has matured into the main alternative to non-free computer systems such as Microsoft Windows and Apple's OS X.

Used in everything from servers to business workstations to cellular phones, Linux's flexibility, stability, and versatility make it an obvious choice for Google's data centers, or your laptop.

If you didn't get a word we just said, just remember this: Linux is free software.

all right then wise guy,

what's free software?

#what's linux?
#what's free
software?

Where does it come from?

#where does it
come from?

#isn't linux all text
and stuff?

#aren't there like a
thousand different
kinds of linux?

#what can I do with
it?
#what can i run on
it?
